

NEMESIS GOLD RODS

NEMESIS GOLDEN RODS are the newest and most sensitive dowsing - long range locators for searching gold available!

NEMESIS GOLD RODS have been designed with the accumulated knowledge gained from many years using gold detectors and directional dowsing rods by experienced gold dowsers. We set the goal to create a better dowsing rod in terms of quality, durability and performance.

During operation NEMESIS rods swing freely to reveal the direction of the selected treasure or mineral deposit. Unlike other dowsing rods NEMESIS is **well balanced and stable**, NEMESIS GOLD RODS will not swing erratically or loose balance, even under windy conditions. Hold NEMESIS for the first time and you will be amazed at how stable it is! When NEMESIS finds the location of the gold / treasure, shorten the antenna. NEMESIS now operates in a circular pattern over the top of the target.

FAKE NEMESIS RODS ALERT!

Only original NEMESIS rods come with curved GDI GOLDEN RODS logos.

NEMESIS rods are 24K gold plated to enhance the attraction when searching for gold targets. This way a gold sample is almost not necessary when operating NEMESIS!.

sample compartment

telescopic antenna

handle

increase target selectivity NEMESIS features a **sample compartment** at the telescopic antenna base. Users of NEMESIS rods insert a small sample - or a combination of samples - of the material they searching for inside the compartment. That's how NEMESIS is tuned to search for a specific treasure that contains that same kind of materiel. For example, when searching for gold, insert a gold piece into the sample compartment. You can use NEMESIS rods to search for gold, silver, mercury, lead, copper, diamonds, oil, water or other substance. Behind the sample compartment is NEMESIS **power tube** where a small amount of a special radioactive mineral ore is used to stimulate it's crystals in order to amplify the weak attractions from distant targets which would be otherwise out of range from competitor's long range locators.

Users of long range directional dowsing rods report several **failures of their antennas** that can break easily when hit obstacles or drop down by accident. NEMESIS telescopic antenna is a durable and thicker at the antenna body and it's bolt to withstand knocks and hard outdoor usage.

NEMESIS GOLD RODS are used to search for large or very small treasures. The antenna length can be adjusted according to whether you are looking for close by or long range targets. Shorten the antenna to locate only sources of attraction that lie close by and for more accurate pinpointing. Or extend the antenna when searching for more distant targets. NEMESIS is set for both short and long range operation with the antenna fully extended.
